"ENTRA CON CIE" livello 3 in mobalità mobile

Gestisci carta | Recupero PUK | Tutorial & Assistenza

The redesign v.0 mainly addresses legibility and accessibility, targeting the needs of Segment #1 users. The new proposal avoids the initial ambiguity of the homepage by reformulating complex technical jargon such as “Configura il tuo dispositivo per accedere senza lettura carta (livello 1 e 2)” and “Registra la carta per accedere con il massimo level di sicurezza (livello 3)”, replacing them with a straightforward and clear explanation.
The second intervention is focused on the modification of the menu, hidden under the hamburger icon in the original design. In version 0, the main sections contained in the app are explicitly displayed inside the bottom navigation bar, while secondary information such as “Privacy Policy” and “Credits”, which does not address any specific task, is placed inside the three-dots icon in the top-right corner of the screen. To address the needs of secondary users - in this case, the difficulty in interpreting a foreign language such as Italian for an international IT student - the globe icon next to the notification icon (top-left) allows users to switch the language from Italian to English.
The “Inserisci PIN” screen has been redesigned to prioritize clear explanations, previously condensed in a verbose and low-contrast text chunk that didn't capture the attention of users. In version 0, the information about where to find the PIN is prioritized and placed in the middle of the screen. As this is the first stage of the third-level authentication process, the screen indicates the user's position within the sequence of operations by displaying “Step 1 of 2”. In the top-right corner of the screen, the question mark icon serves as a shortcut to directly access FAQs, assistance, and contextual tutorials selected according to the current task. Under the code entry field, the redesign transforms the static redirection “Vai in Gestione carta” of the original version into an inline deep-link, reducing the taps required to reach the destination screen.
The second step of third-level authentication is focused on card reading through NFC scanning. To help users orient themselves, the redesign creates a separate screen displaying “Step 2 of 2” instead of placing a mini-screen alongside the “Inserisci PIN” screen. There are clear visual cues that suggest to the user how to perform the task. First of all, an illustration clearly shows where the card must be placed relative to the device.

Then, a timer is displayed to avoid errors due to uncertainty about timing. At the bottom of the screen, a warning icon is followed by a written suggestion on where to place the card and for how long.
Finally, two contextual help features are provided: an inline deep-link redirecting the user to “Tutorial & Assistenza” and the question mark icon in the top-right of the screen. Assistance and tutorials in version 0 of the redesign are located on the same screen instead of being divided into two different sections. All available tutorials are linked at the top of the screen, followed by a FAQ section comprising answers to doubts regarding the most frequent tasks. At the bottom of the page, the assistance number is provided by clicking on “Chiama assistenza”, while clicking on the email automatically redirects the user to their email provider. The redesign also addresses the issue of tutorials being external to the application. In order to simplify access to explanations and additional information, we chose to integrate each tutorial directly into the application without redirecting to external links like YouTube.
